## **ACKNOWLEDGMENT**

The publication of this bulletin was made possible through the efforts and cooperation of many individuals including those in private and governmental organizations. The Florida Agricultural Statistics Service expresses its appreciation of each contributor.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, the Agricultural Experiment Stations and Cooperative Extension Service, University of Florida.

This bulletin is published by the Florida Agricultural Statistics Service, a cooperative office of the USDA, Florida Department of Agriculture; and Agricultural Experiment Stations, University of Florida. Acreage, production, and value data are official statistics assembled under the direction of Wade W. Adams and William C. Erwin of the Florida Agricultural Statistics Service. Additional assistance on this year's book was provided by Ray Crickenberger, Iraides Ojeda and Pat Quittence.

## INTRODUCTION AND SUMMARY OF THE 1989 FIELD CROP SEASON

### INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production, and value of production for all major field crops grown in Florida. The period covered for these crops is from 1979 through 1989. Winter wheat estimates were discontinued after 1978, but were reinstated in the national estimating program in 1985. Therefore, several years are missing from this series.

County data for the major counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1982 through 1989. Estimates for the years 1983 through 1987 will vary for some crops from those published in previous annuals because of changes in total acreage or production resulting from the review of the 1987 census of agriculture.

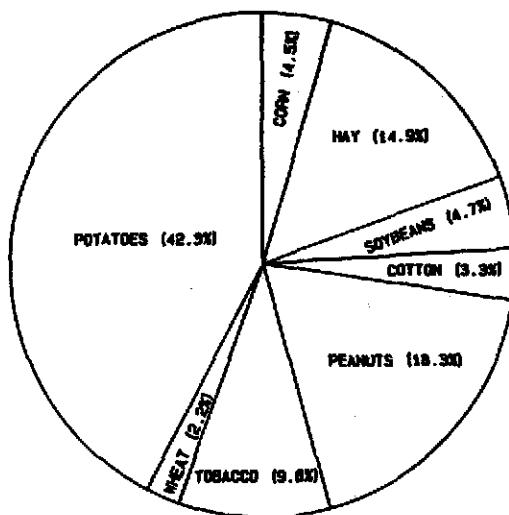

### SUMMARY, 1989 SEASON

Winter temperatures were warmer than normal for the most part. The only major freeze in early 1989 was on February 24 and 25. The freezing temperatures damaged the winter wheat and spring potato crop. Tobacco plant beds had some tip burn. Some leaf burn occurred on sugarcane, but it did not affect the coming year's crop.

Most areas of the State were short on soil moisture until late March when the Panhandle and northern Peninsula received needed rain. The soil moisture in the Panhandle was mostly adequate through April with the Peninsula being short. During the last week of April and the first week of May, widespread rains improved conditions on the Peninsula. From the second week of June through the end of July, the Panhandle received over 22 inches of precipitation. Some areas in the Panhandle recorded over 6 inches in a 24 hour period. The flooding and excessive washing damaged some of the crops. The wet conditions delayed hay harvest and planting of double crop soybeans. A few fields of late wheat were not harvested. It was mid-July before farmers in some parts of the Panhandle were able to harvest hay. Rains on the Peninsula, which was short of moisture in most areas, kept crops growing, but were not of the magnitude to build up soil moisture.

Harvesting of most spring sown crops progressed well and without delays. Peanut harvest was delayed in some areas because of the lack of soil moisture. Planting of small grains was delayed at times due to the lack of top-soil moisture. The sugarcane crop that had not been harvested by December 24 was heavily damaged by freezing temperatures on December 24 and 25. About 50 percent of the sugarcane crop had been harvested before December 24.

### DISTRIBUTION OF FLORIDA SELECTED CROP VALUES, 1989

Winter wheat and other small grains received leaf burn. There was no major tropical storm damage during the year.

Both the planted and harvested acres of corn were up from the previous year. Acres planted at 115,000 acres were up 15 percent and acres harvested for grain at 80,000 acres were up 23 percent. The average yield was 74 bushels per acre, up 16 bushels from 1988. The season average price of \$2.30 per bushel was down 70 cents from a year earlier. The value of production at \$13,616,000 increased 20 percent from last year. This year's corn crop was planted and harvested on time. The increase in yield over 1988 was due to better moisture conditions in 1989.

The 130,000 acres planted to soybeans was up 8 percent from the previous year. Acres harvested for beans totaled 120,000 acres, up 4 percent from a year earlier. The average yield of 22 bushels per acre was down 7 bushels from 1988. The season average price of \$5.45 per bushel was down \$2.05 from the previous year. Value of production totaled \$14,388,000, down 42 percent from last year. The wet June in the Panhandle delayed the planting of double crop beans and also damaged the crop that had been planted before the heavy rains.

A total of 598,000 tons of hay was cut from 260,000 acres during 1989. This production was 8 percent less than the previous year. The average yield of 2.3 tons per acre was 4 percent less than 1988. Average price per ton at \$76.00 was \$8.00 more than a year earlier. The value of production at \$45,448,000 was 3 percent more than the previous year. The Panhandle hay producers had trouble getting hay cut and cured in June and July. The Peninsula hay producers had problems with the lack of foliage growth due to moisture shortages in many areas most of the growing season.

The 95,000 acres planted to peanuts was 3 percent less than in 1988. Of the total acres, 87,000 acres were harvested for dry nuts. The remaining acreage was either harvested as "green peanuts", cut for hay, pastured, or abandoned. The average yield of 2,470 pounds per acre was down 70 pounds from the previous year and the lowest since 1970. Total production at 214,890,000 pounds was down 6 percent from the previous year. The average price per pound of 26.0 cents was down 3 percent from 1988. Value of production at \$55,871,000 was down 9 percent from the previous year.

The 25,500 acres planted to cotton was down 23 percent from that planted a year earlier. The 25,000 acres harvested was down 14 percent from 1988. Yields averaged 557 pounds per acre, up 9 pounds from the previous year. The production of 29,000 bales was 15 percent less than last year. The 1989 season average price of 65 cents per pound was 13 cents higher than the previous season.

Tobacco acreage for harvest in 1989 totaled 6,700 acres, a 300 acre increase from the previous year. The average yield of 2,650 pounds per acre was down 30 pounds from 1988. The production of 17,755,000 pounds, was up 4 percent from a year earlier. The average price for all grades sold was \$1.676 per pound, up 2.8 cents from last year. The crop was valued at \$29,757,000, 5 percent higher than last year.

Acreage planted to winter wheat totaled 80,000 acres, up 7 percent from 1988. Of the total acreage planted, 65,000 acres were harvested for grain, down 7 percent from last year. The average yield was 29 bushels, down 7 bushels from a year earlier. The total production was 1,885,000 bushels, down 25 percent from 1988. The average price of \$3.50 per bushel was up 20 cents from the previous year. The crop was valued at \$6,598,000.

The area for sugarcane for sugar and seed totaled 420,000 acres, 1,000 acres less than the previous season. Of this total, 405,000 acres were cut for sugar and the remaining 15,000 acres were for seed. The average yield was 31.4 tons of cane per acre, 0.2 ton below the season before. The value of production for the 1989 crop will be available in January 1991. The value of the 1988 crop for sugar and seed combined, was placed at \$433,710,000, up 4 percent from 1987.

The 1989 crop had some leaf burn from the February 24 and 25 freeze and the unharvested crop was extensively damaged by freezing temperatures on December 24 and 25. The damage from the freeze of December 24 and 25 ranged from leaf burn to killing the total plant above the ground. None of the acreage was abandoned. Some sugarcane that was planned for use as seed had to be used for sugar, and seed was obtained from acreage where stalks were not killed. Almost 50 percent of the crop had been harvested by December 23.

The first mills opened the last week of October and the last mill was closed by mid-March. Florida continued as the leading State in production of raw sugar in 1989, producing 1,399,000 tons. This was 44 percent of the U.S. raw sugar production from cane or 21 percent of total U.S. sugar production from both cane and beets. Blackstrap molasses, 80 degree Brix, produced from the 1989 crop totaled 100,042,000 gallons, up 8 percent from the previous season.

Utilized production from the 1989 Pecan crop was 7,000,000 pounds, up 17 percent from a year earlier. Of the total utilized production, 4,000,000 pounds were improved varieties and 3,000,000 pounds were native or seedling varieties. The average price for all pecans at 52.1 cents per pound was 1.5 cents higher than the average for the previous year's crop. The value of the crop at \$3,650,000 was 20 percent higher than 1988.

The area planted to potatoes including both winter and spring crops, totaled 43,600 acres, 18 percent more than last year. Acres harvested at 42,600 were up 18 percent from 1988. The average yield for total crop was 195 cwt per acre, down 31 cwt from the previous season. Production, including both winter and spring potato crops, totaled 8,304,000 cwt, an increase of 2 percent from a year earlier. The average price of \$15.50 per cwt for all seasons, was up \$9.85 from the previous year.

Planted acreage of winter potatoes totaled 7,600 acres, 4 percent more than 1988. A total of 7,600 acres was harvested. The yield was 190 cwt with a production of 1,444,000 cwt. The "red-skinned" varieties are the dominant potatoes grown for winter harvest in south Florida. Most of the winter crop is sold for tablestock.

Spring potatoes in the Hastings area, which includes Flagler, Putnam, and St. Johns counties, planted 28,500 acres in 1989. Of this total, 28,000 acres were harvested. The yield was 195 cwt per acre with a production of 5,460,000 cwt. The "white-skinned" varieties dominate, with most normally going to the chip market.

The other spring group which includes all the spring potatoes grown outside the Hastings area, totaled 7,500 acres planted and 7,000 acres harvested. The other spring yield per acre was 200 cwt and production was 1,400,000 cwt.

A freeze on February 24 and 25 damaged potato vines in the Hastings area. The potatoes that would have been harvested in March and April had the heaviest damage and did not recover from it. Some of these potatoes were replanted for late harvest. The fields with small vines, that the farmers were able to cover with soil, had little damage. Some acreage was not damaged as it was not up or planted when the freeze came. Some acreage in the other spring group was in areas where temperatures were not as cold and, therefore, escaped injury.
